TITLE:

Method of analyzing directional multicircuit filters with rotating field-polarisation

PERIODICAL:

Radiotekhnika, v. 17, no. 6, 1962, 3 - 10

TEXT:

A general method is developed for analyzing directional filters with rotating polarization, for any number of volume resonators of a beam-communication network. The method is based on the theory of ultrahigh-frequency networks. For purposes of analysis, it is convenient to divide the multicircuit directional filter into separate, fairly simple, elements and to determine first the scattering - (or transmission) matrices of these elements. Then, the resultant matrix of the device as a whole is determined from the matrices of the elements. First, the general problem of determining the scattering matrix of coupled linear networks is considered. It is assumed that several networks, with scattering matrices  $S_1, S_2, S_3$ , etc., are

Card 1/4

S/108/62/017/006/001/007  
D407/D301

Method of analyzing ...

connected to the input of a network with matrix  $\bar{S}_1$ . It is required to determine the scattering matrix  $\bar{S}$ , which connects the column-matrices of the voltages  $\bar{U}_\alpha$  of the incident and  $\bar{U}_\alpha'$  of the reflected waves at the free terminals of the device, formed by the coupled networks. The resultant matrix  $\bar{S}$  is set up from the coefficients of the matrices  $\bar{S}_1, \bar{S}_2, \dots$ . Thereupon matrix equations are derived for the voltages  $\bar{U}$  of the incident- and reflected waves. Then the coupling conditions are imposed on these equations, and the voltage  $\bar{U}_p$  at the coupled terminals is determined from the equations. The sought-for scattering matrix is

$$\bar{S} = \bar{A} + \bar{B} (\bar{E} - \bar{D})^{-1} \bar{C}, \quad (11)$$

where  $\bar{A}, \bar{B}, \bar{C}$  and  $\bar{D}$  are submatrices of the matrix  $\bar{S}_1$ . Further, the above method is used for determining the scattering matrix of multi-circuit directional filters with rotating polarization. In the filter under consideration it is convenient to separate the following two principal elements: a perpendicular joint between rectangular- and

Card 2/4

S/108/62/017/006/001/007  
D407/D301

Method of analyzing ...

circular waveguides, and a circular-waveguide section. It is convenient to consider the rotating field in the circular waveguide as a set of 2 linearly-polarized fields  $TE_{11}$ . Since the excitation is effected through an opening which is much smaller than the wavelength, it is possible to use the theory of wave diffraction by small holes (as developed in the references for waveguides). As the scattering matrix is unitary, it is not necessary to calculate all the matrix coefficients, but only the coupling coefficients between the rectangular- and circular waveguides. After calculations, one obtains the scattering matrix. The non-zero elements of this matrix are the coefficients

$$p = \frac{\beta_1 \cdot -1\psi_1}{(t_{11} - \beta_1 \cdot -1\psi_1 t_{12})^2 - (t_{21} - \beta_1 \cdot -1\psi_1 t_{22})^2}, \quad (20)$$

Card 3/4

Method of analyzing ...

S/108/62/017/006/001/007  
D407/D301

$$q = \beta_1 - \frac{\gamma_1^2 e^{-i\psi_1} t_{12} - p (t_{21} - \beta_1 e^{-i\psi_1} t_{22})}{t_{11} - \beta_1 e^{-i\psi_1} t_{12}}, \quad (21)$$

p denoting the coefficient of transmission from one rectangular waveguide to another (through the circular resonator), and q -- the coefficient of transmission from one branch to another (of the same rectangular waveguide). There are 9 figures.

## Complex Waveguide Systems

SOV/6456

COVERAGE: The book discusses the theory of complex waveguides with variable cross sections and of circular waveguides containing irregularities. External parameters of waveguide circuit elements are defined and equivalent circuits explained. Wave matrices and their connections in waveguide multiterminal networks are described. Calculations of flat-lateral irregularities, filters, ring and slit waveguide coupling rotation joints, antenna switches, and systems containing ferrites are given. The authors resort to the use of specific methods based on the wave characteristics of rapidly varying fields for calculating electrical parameters. Ch. I, II, III, and X were written by K. N. Tsibizov, Ch. IV, VI, and VII by B. M. Mashkovtsev (excl. section 30); Ch. V, VIII, IX, and section 30 of Ch. VI were written by N. L. Kogan. The authors thank G. V. Kisun'ko, Corresponding Member of the Academy of Sciences USSR, and B. F. Yemelin and N. I. Ivanov, Candidates of Technical Sciences, for their assistance. There are 42 references: 37 Soviet and 5 English.

TITLE:

Reflectometers with inseparable indication of  
both incident and reflected waves

PERIODICAL:

Radiotekhnika, v. 18, no. 3, 1965, 10-16

NOTE:

The authors describe and analyze the errors of the so-called inseparable measurement of reflection coefficient (simultaneous observation of incident and reflected waves). The directional coupler has a phase-shifter instead of load in secondary line. The phase shift introduced may be controlled during measurements and read out on the phase-shifter scale. The sources of errors in the measurement of the reflection coefficient using this method are connected with phase-shifter scale calibration, mismatch between the indicator and line and finite coupler directivity. The phase-shifter calibration error

UETA 1/2

Reflectometers with...

S/108/63/018/003/002/008  
D201/D308

depends on whether the coupler is adjusted to the "incident" or "reflected" waves. Independently of the coupler adjustment the maximum error in the measurement of the reflection coefficient modulus is determined by the modulus of the reflection coefficient of the indicator. The largest relative error in the measurement of the modulus of reflection coefficient is introduced by the mismatch between the indicator and line. The measurement of complex reflection coefficient within a certain frequency band by this method is less time-consuming and can be made fully automatic. There are 3 figures and 1 table.

TITLE: Waveguide converter filter, Class 2L, No. 171455

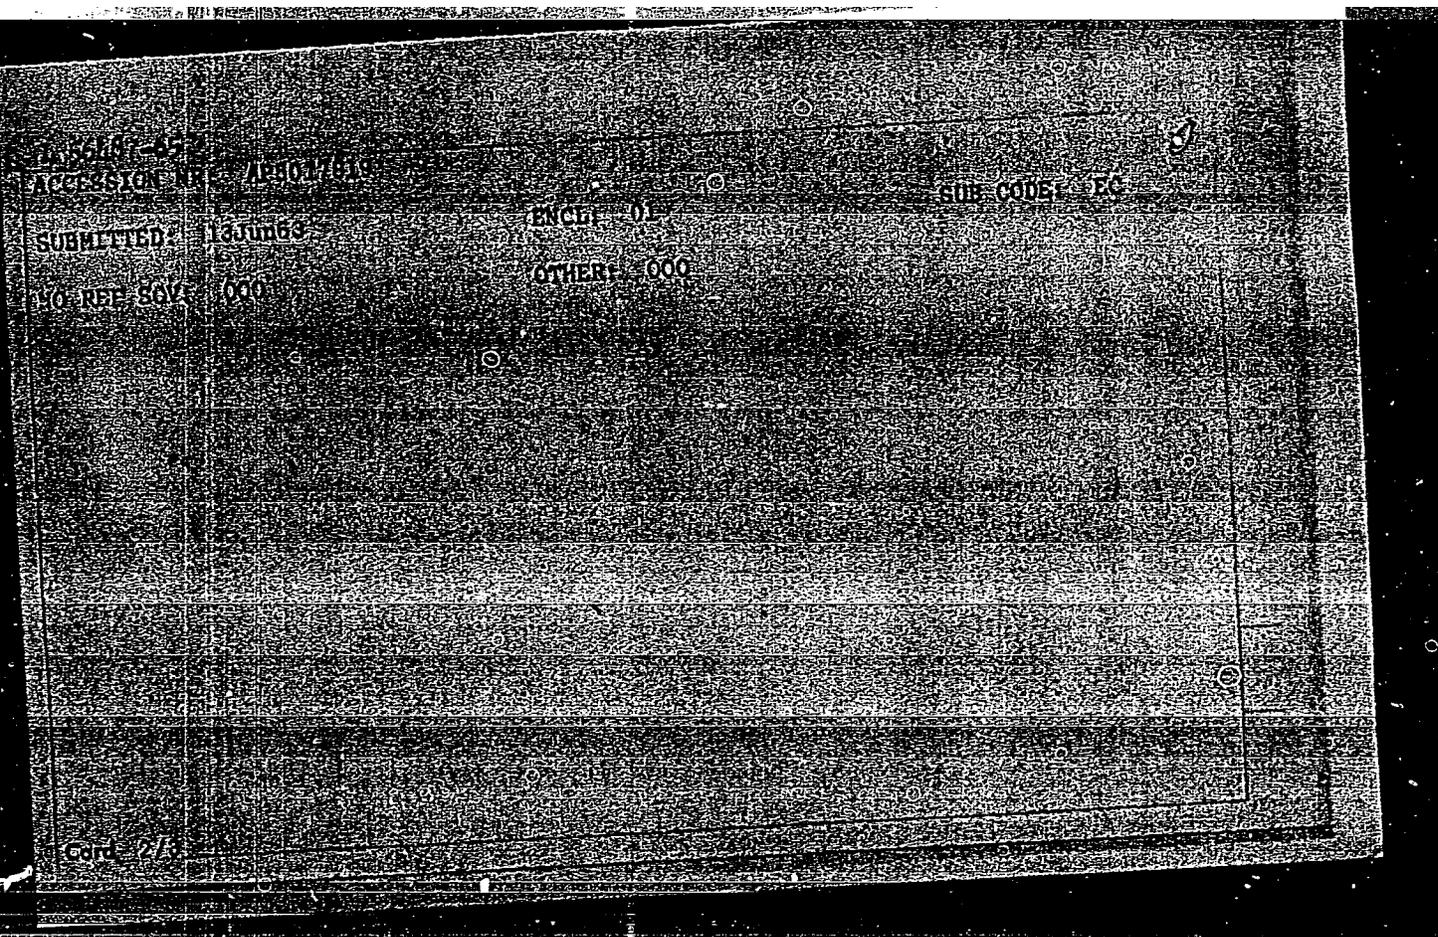

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 11, 1965, 45

TOPIC TAGS: cavity resonator, waveguide filter, waveguide iris

ABSTRACT: This Author's Certificate introduces a waveguide converter filter which consists of a rectangular and a circular waveguide. The design provides for simultaneous separation of frequency channels and conversion of electromagnetic waves. The rectangular and circular waveguides are connected by cavity resonators made in the form of rectangular waveguide sections. The resonators have irises and adjustment screws and are connected to the rectangular and circular waveguides through narrow slots.

AUTHORS: Mashkovtsev, B. M., Bensman, L. Z., Khokhrev, A. A.

TITLE: A Broadband Waveguide Directional Coupler

PERIODICAL: Radiotekhnika, 1960, Vol. 15, No. 4, pp. 8 - 17

TEXT: In the article under review, the authors study the demands made on a directional coupler which warrants the necessary accuracy for measuring the reflection coefficient when incident waves and reflected waves are indicated separately. A method of calculation is suggested, and experimental results are given. First, the demands made on the parameters of the directional coupler are studied. The approximate formula (4) for the load reflection coefficient is developed, and formula (5) is given for the weakening of the directional coupler, and formula (6) is written down for the directivity of the coupler. In the following, the authors discuss the sources of error in measuring the load reflection coefficient:

1) errors which are due to reflection produced by the load of the auxiliary line;  
2) errors due to the finite directivity of the directional coupler; 3) errors due to the unequal character of measurement of the transient weakening in the wave range. In the following, the directional coupler is regarded as being composed of

Card 1/3

A Broadband Waveguide Directional Coupler

80159  
S/108/60/015/04/01/007  
B014/B014

two parallel rectangular waveguides. The coupling between these "waveguides" is brought about by two spaced slits which are arranged in T-shape (Fig. 3). The calculation of T-shaped slit coupling elements is discussed in detail, in which connection formulas (15) are developed for the two transmission coefficients. The transient weakening of these coupling elements is calculated from (19), while formula (20) is given for the directivity of the coupler. Next, the authors give a detailed description of a system consisting of  $N$  equal coupling elements which are arranged along the waveguide. It is noted that calculation of the transient weakening in second approximation from formula (29) is sufficient for practical purposes. Formula (30) is used to calculate the directivity of a multielement directional coupler, and formula (31) is given for the spacing of the coupling elements. Within a certain range it is thus possible to obtain perfect directivity at some points. Some points depend on the choice of coupling elements, and others on their spacing. The transient weakening and the directivity of the directional coupler were measured by the standard method of substitution. The power at an indicator was kept on the same level by means of a high-precision attenuator. The directivity of the coupler could be measured without using a special method. B. F. Yemelin and the mathematician P. L. Chebyshev are mentioned in this article. There are 8 figures and 5 Soviet references. ✓

Title: Continuous Regulation of Transformation Coefficient

Original  
Periodical: Radio, 1956, No 4, 44

Abstract: It is possible to connect the tuned circuit in an autotransformer circuit by dividing the inductance coil into 2 sections with respect to the coefficient of transformation. The coefficient of transformation of such a connection can be changed by moving a copper ring, placed on the core between sections. The resonant frequency of the tuned circuit remains nearly constant thereby.

TITLE: The Development in Production of Centrifugal Compressor Engines and Turbines in the Nevskiy mashinostroitel'nyy zavod imeni V. I. Lenina (Nevskiy Machine Works imeni V. I. Lenin)

PERIODICAL: Tr. Nevsk. mashinostroit. z-da, 1958, No. 3, pp. 5-23

TEXT: The production<sup>4</sup> of compressors<sup>3</sup> is concentrated in the work in an individual shop subdivided into several specialized sections of: housing, rotors, reducers, assembly, and control-testing. The shop is equipped with 7 vertical lathes, balancing machines, boring machines, and others, which are equipped with various accessories and special tools. The turbine production was developed simultaneously. As a result of the unification performed, the total series of steam turbines of 4,000 - 6,000-kw power (condensation, thermofication, driving turbines, and turbines with industrial bleeding-off steam) have up to 70% of the common units. A separate turbine shop was organized with sections of machining

and assembling the control units and steam distribution units, condenser production, and others; these sections are equipped with profiling lathes for discs, balancing machines for rotors, equipment for heat testing the shafts, stands for checking and testing turbines, and others. The introduction of advanced technology reduced the labor-consumption by 50 - 60%. The same shop produces gas turbines with blades of fire-proof steels. The specialized shops and sections are organized according to the technologic principle. The following new processes were introduced: finishing pass with broad cutting tools for processing the planes of horizontal joints, boring according to radial and axial braces, application of mechanized boring bars for boring closed structures. Guides, special patterns, and copying units at the machines for producing blade diffusers and diaphragms of compressor engines, special accessories for welding the diaphragms of high-pressure turbines, and the molding of diaphragms by models with metallic ribs are widely applied. The wheels and rotors are mounted on a stand in the vertical position; when wheels are fitted on, the end of the shaft is cooled down in liquid nitrogen. There are 22 figures.

TITLE: Substituted phosphinic acids with their derivatives. I. Synthesis of chlorides of phosphinic acids with diene and acetylenic radicals

SOVIET: Zhurnal Obshchey Khimii, v. 35, no. 9, 1965, 1977-1984

TOPIC TERMS: phosphinic acid, organic synthetic process, tertiary amine, proton resonance, phosphorus chloride, ester, chloride, IR spectrum

ABSTRACT: Chlorides of phosphinic acids with dienic radicals were synthesized by acetylenation of chlorides of the corresponding chloroalkenephosphinic acids with triethylamine. The corresponding chloroalkenephosphinic acids were produced from the diene hydrocarbons and PCl<sub>5</sub>. The chloride of 2-methyl-4-chloro-2-butene-1-phosphinic acid was produced analogously to the corresponding acid with triethylamine. Chlorides of phosphinic acids with acetylenic and other radicals were produced by reaction of esters of the corresponding phosphinic acids with PCl<sub>5</sub>. The new compounds include the chloride ester of isomer 3-oxo-1-phosphinic-1 acid, produced for one of the products by an internal rearrangement of isomer 2 phosphite with brom-

TITLE: <sup>1</sup>Preparative method for phosphorus-containing polyesters. Class 39, No. 183385 /announced by Leningrad Technological Institute imeni Lensovet (Leningradskiy tekhnologicheskii institut)/

SOURCE: Isobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 13, 1966, 77

TOPIC TAGS: phosphorus, polyester, polycondensation, phosphonic acid, glycol

ABSTRACT: This Author Certificate presents a method for preparing phosphorus-containing polyesters by polycondensation of alkylphosphonic chlorides with aliphatic or aromatic glycols. To broaden the assortment of phosphorus-containing polymers having high fire resistance and good adhesion to metals, chlorides with 1,3-diene groups at the phosphorus atom, e.g., (2-methyl-1,3-butadienyl)phosphonic chloride, are used as the alkylphosphonic chlorides. TITLE: Approximation of volt ampere characteristics of semiconductor devices with p-n-p-n structure

SOURCE: Vsesoyuznaya nauchnaya sessiya, posvyashchennaya Dnyu radio. 22d, 1966. Sektsiya poluprovodnikovyykh priborov. Doklady. Moscow, 1966, 31-36

TOPIC TAGS: volt ampere characteristic, characteristic equation, ~~p-n-p-n~~ semiconductor device

ABSTRACT: The volt-ampere characteristics for p-n-p-n semiconductor devices such as diodes and thyristors are approximated with high order polynomials. A large number of experimental points is required for the above process and the calculations are performed on a computer. An approximation method that reduces the order of above polynomials is obtained by using Chebyshev polynomials. An exponentially-logarithmic approximation is obtained that is simple in form and introduces a relatively low error; it requires uniform approximations for only three points of the real characteristics. The described methods were used for approximating the volt-ampere characteristics of D228V diodes. The calculated RMS error of the polynomial was 6.8% for currents between 0 and 0.495mA; the error for the exponentially-logarithmic method did not exceed

TITLE: High-frequency Hardening (Zakalka tokami vysokoy chastoty)

PERIODICAL: Elektr. i teplovozn. tyaga, 1957, Nr 9, pp 18-20

ABSTRACT: HF current is coming into ever wider use to harden rolling-stock details to improve the strength and wear resistance of parts exposed to rubbing contact. It is recommended that the inside diameter of the inductor used to harden (H) cylindrical articles be 4 mm larger than the outside diameter of the part (P) being heated. The depth to which rubbing P of many machines subject to wear are H should in most cases be  $\geq 1.5-2$  mm. In the case of P subject to crushing, penetrating loads, etc., the depth of the H zone is usually set at  $> 4-5$  mm. An equation is suggested for determination of the required H depth of rubbing P:  $v = KI + 0.5$ , where v is the required H layer depth, in mm; I is the maximum permissible wear of rubbing parts determined by locomotive repair rules, in mm; K is the H depth factor, depending upon the conditions of operation and the P repair technique (0.7-1.3 is taken for locomotive P). A table of current

Card 1/2

137-58-5-10038

High-frequency Hardening (cont. )

frequencies and generator models is presented. It is established that H of teeth limited to the working portion of the profile only results in the appearance of microscopic cracks in the transition zone. Rational procedures for the H of locomotive P by HF current should be developed in the following sequence: 1) determine the dimensions of the working surfaces subject to H and the boundaries between the portion of the P subject to hardening and the remainder; 2) determine H depth and the hardness of the upper layers of the surface of the P; 3) select the H method and the type of generator, in terms of frequency and power; 4) develop and make the necessary fixtures for mounting, heating, and H of the P; 5) run a test H of the P and, on the basis of metallographic investigation and the technical specifications, select the most desirable H regime; 6) compile a flow chart for heat treating the P with indication of the H regime and the technical inspection operations. The costs of HF H of P are  $\sim 85-88\%$  lower than when carburizing is employed. The heat-treatment cycle of a P with HF is  $\leq 3$  hours as against 25-30 hrs with carburization; it is only a few minutes or seconds in the H of some locomotive P. In addition, induction heating improves the quality of the heat treatment and, as a result, increases the length of locomotive mileage between overhauls and also markedly improves the working conditions for the personnel.

TITLE: A mechanism for forced impact destruction of a diaphragm. Class 47, No.  
188810

SOURCE: Izobreteniya, promyshlennyye obrazttsy, tovarnyye znaki, no. 22, 1966, 140

TOPIC TAGS: pneumatic device, gas pressure

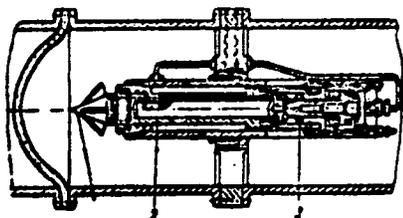

ABSTRACT: This Author's Certificate introduces a mechanism for forced impact destruction of a diaphragm. The unit consists of a striker and a ball catch which holds the striker in the cocked position. The kinetic energy of the striker is increased by rigid connection to a piston which uses gas pressure to move the striker after the ball catch is released.

TITLE: New data on magnetophonon oscillations of the longitudinal magnetoresistance of n-InSb

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 47, no. 5, 1964, 2007-2009

TOPIC TAGS: galvanomagnetic effects; magnetoresistance; magnetophonon oscillation; indium antimonide

ABSTRACT: In this continuation of earlier work (ZhETF v. 47, 444, 1964), the measurements were made in pulsed magnetic fields and have shown that the magnetoresistance of n-InSb continues to oscillate also at fields stronger than in the earlier study (stronger than 38 kOe). The results are shown in Fig. 1 of the enclosure. The oscillation at stronger fields ( $H > 40$  kOe) is attributed, in

3

analogy with the earlier studies in weaker fields, to spin splitting of the Landau levels, although it is pointed out that there are no experimental data on the transverse effect at strong fields. The value obtained for the g factor on the basis of this assumption ( $g = 56$ ) is in good agreement with other data. A more accurate analysis calls for further theoretical development. "We thank V. L. Gurevich and S. T. Pavlov for a discussion of the results."

TITLE: Oscillations of the Magnetoresistance of tellurium

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki. Pis'ma v redaktsiyu. Prilozheniye, v. 4, no. 9, 1966, 362-364

TOPIC TAGS: tellurium, magnetoresistance, galvanomagnetic effect, semiconductor carrier, carrier density, quantum resonance phenomenon

ABSTRACT: The purpose of the article is to explain why the magnetoresistance of tellurium exhibits in a strong magnetic field periodicity in the reciprocal field  $1/H$ . Arguments favoring magnetophonon resonance as the cause of the observed oscillations in tellurium are presented on the basis of various experimental data and on the basis of an earlier analysis by one of the authors (Shalyt et al., ZhETF v. 47, 444, 1964). Although a quantitative analysis of the experimental curves can hardly lead at present to unambiguous results, since there are not enough available data on the physical properties of tellurium, it is possible to correlate the results of optical and thermoelectric investigations with the optical frequencies causing magnetophonon resonance in Te. The authors thank R. V. Parfen'yev and I. I. Farbshteyn for a useful discussion of the experimental results, and V. L. Gurevich and Yu. A. Firsonv for an in-

**AUTHOR:** Mashovats, E., Chief, Directorate of Technical Maintenance,  
Main Administration of the GVF

**TITLE:** Further Reduction of Between-Overhaul Periods (Za dal'neysheye  
sokrashcheniye srokov remonta aviatsionnoy tekhniki)

**PERIODICAL:** Grazhdanskaya aviatsiya, 1958,<sup>15</sup> Nr 6, pp 30-31 (USSR)

**ABSTRACT:** The top official of the aircraft maintenance and repair organization of the Aeroflot deals with current problems in his domain. The central issue is the length of the idle period of flight equipment, which he considers still to be excessive. The immediate goal, now about to be introduced in some repair establishments, is an 8 to 10 day margin for overhaul of piston-engine aircraft. An illustrative statement is made that if a sizeable repair establishment were to cut idle time by 15 days per plane per year, this would be equivalent to 8 additional aircraft in operation. The article is divided into four sections and a conclusion.

Card 1/3

84-58-6-31/59

**Further Reduction of Between-Overhaul Periods**

The first section deals with idling of aircraft before and after overhaul. Cases of such delays, in operational units and in repair establishments, are cited. The second section discusses cutting the overhaul time. The dependence of the duration of the overhaul on the number of aircraft in the process is explained by a nomograph. A better work organization is urged, in the first place, for shops working on the airframe. The third section deals with the reorganization of work schedules on airframe repair, partly because of the introduction of new types of equipment, partly because of the necessity of reducing congestion of workers in certain work areas. Night shifts may become necessary under the circumstances in areas of high work volume to avoid delays in the delivery of aircraft. An all-over rescheduling and readjustment of the work process in view of local circumstances is considered the basic remedy for excessive idle time. The last section stresses the necessity of a more thorough planning,

Card 2/3

Further Reduction of Between-Overhaul Periods

84-58-6-31/59

an exacting hour-to-hour control of the work, and a wider employment of the creative initiative of all workers in introducing more effective methods and tools for operations. The conclusion deals with the beneficial effects of shorter idle time on work conditions in general but also stresses the responsibility of central supply organs in the timely furnishing of the repair workshops with spare parts and materials, on which the progress of the work fully depends. A nomograph accompanies the text.
